10 **Abstract: Objective:** To present intraductal carcinoma of the prostate from the perspective of its
11 definition, diagnostic criteria, significance, and therapeutic implications. **Material and methods:** The
12 relevant literature from recent years regarding intraductal carcinoma of the prostate (IDC-P) has been
13 studied. **Results:** IDC-P is a recently introduced entity in the WHO classification of prostate carcinomas
14 and most often represents a late stage in the evolution of prostate tumors, and much more rarely, a precursor
15 lesion for invasive carcinoma. IDC-P poses a challenge for pathologists in terms of diagnostic criteria and
16 differential diagnosis with other similar lesions, is associated with negative prognostic factors, and may have
17 therapeutic implications. **Conclusions:** IDC-P is an important pathological finding that should be
18 thoroughly evaluated and documented in both needle biopsies and radical prostatectomy specimens. Its
19 identification has critical clinical implications for the prognosis and management of prostate cancer.

20 **Keywords:** prostate cancer, intraductal carcinoma, prognosis, therapy
